

The Key to Better Health is Right Under Your Nose.

Gum disease, also called periodontal disease, could put you at increased risk for:

- Heart disease
- Stroke
- Diabetes

...and possibly more

Your mouth can say a lot about you. Bleeding or swollen, red gums are typically the first signs of gum disease. However, the signs aren't always so obvious; sometimes it's what you **can't** see in your mouth that may be detrimental to your health.

Ask your dental professional about salivary diagnostic tests from OralDNA® Labs. They're easy saliva tests that can help your dental professional assess your unique periodontal disease risk levels, so you can make necessary oral health and lifestyle changes to protect your overall health.

Schedule an appointment with your dentist today.

Speak to your dentist about these tests, or to find a dentist near you who administers these tests, visit: www.OralDNA.com/dentistfinder
